

Fix slow or unstable home internet in under 10 minutes — without calling your ISP

Why This Guide Exists: to help home office and remote workers troubleshoot and fix common internet issues in minutes — built for busy families & remote professionals.

Slow or unstable Wi-Fi affects work calls, online learning, and family downtime. Most issues are caused by coverage, placement, or device overload — not your internet plan.

Step-by-Step Wi-Fi Checklist:

- ✓ Restart your modem and router (power off for 30 seconds).
- ✓ Check how many devices are connected — pause unused streaming or downloads.
- ✓ Move closer to the router to test signal strength.
- ✓ Place the router centrally, off the floor, and not hidden.
- ✓ Avoid interference from microwaves, baby monitors, or thick walls.
- ✓ Test one device at a time to identify if the issue is isolated.
- ✓ Restart and update phones, laptops, tablets, and smart TVs.

Pro Tip

Slow Wi-Fi is usually a coverage issue, not your internet speed. Small placement changes often make the biggest difference.

WHEN TO ASK FOR HELP

IF YOUR INTERNET DROPS FREQUENTLY, CERTAIN ROOMS NEVER GET SIGNAL, OR ISSUES RETURN REGULARLY, PROFESSIONAL SUPPORT CAN SAVE TIME AND FRUSTRATION.

Community Support from d10 IT Solutions

We offer Free Friday remote IT checks for the community. No obligation — just practical help when you need it.

Protecting people, not just devices.
